

HLM Project
Codebook

Level	Variables	Coding	Values
	3 pollid	2 digit ID for poll	1=NH, 2=NIC2, 3=BTP02, 4=BTP04, 21=BTP07, 22=GB_Health, 23=GB_Mon, 25=GB_GE, 26=AU
	3 country	Country of poll	1=US, 2=UK, 3=AU
	3 mode	Online or face-to-face	1=Online, 0=FTF
	3 t1knowlevel	Mean t1know for entire poll (T0 sample)	
	3 numitems	Number of items in knowledge index	
	2 pollgroup	4 digit ID: pollid+group no.	I have already eliminated this. Eliminating variables is easy but go ahead and do it if you haven't
	2 group	Group ID -- should get rid of this	
	2 groupsize	No. of ppl in group	
	2 pfemale	Proportion of female in group	
	2 phighknow	Proportion of ppl above 75-percentile on t1know	
	2 phighinc	Proportion of ppl above 75-percentile on hhincome	It will allow for us to easily do group wise estimates with grp as levels of analysis - but we can create this later as well
	2 pminority	Proportion non-white	
	2 phigheduc	Proportion of "BA or above" on educ (i.e., educ4=4)	
	2 meant1know	Group mean of t1know	
	2 meant2know	((didn't know about this?))	
	2 sqrtavgvar	Sqrt of the average group-wise variance of t1 attitudes (i.e., sqrt > mean > group var of index1, group var of index2, ...)	I don't know what these are doing here - I can't think how they will have an impact
	2 gr_eval2a	Group mean of "Moderator gave opp for all to participate" (-reverse code this)	
	2 gr_eval2c	Group mean of "Mod sometimes tried to influence"	
	2 gr_eval2e	Group mean of "Mod made sure oppoting args considered" (-reverse code this)	The only variable we needed for whether participant has read briefing document or not
	1 t1know	Knowledge Index T1	
	1 t2know	Knowledge Index T2	
	1 ppage	Age in years	
	1 educ4	4 category education level	1=Below HS, 2=HS grad, 3=Some col, 4=BA+
	1 minority	Non-white dummy	1=Non-white, 0=White
	1 hhincome	17~19 category hhincome (no. of categories varies by poll)	Categories are useless - unless they are the same...
	1 female	Female dummy	1=Female, 0=Male

1 inc70plus	High income dummy	1=70k+ (for some polls, 65k+)
1 t1polint	Political interest (0~1 scale)	

** We should change variable names to match the "correct" variable names listed here so that we can merge later on.
